## Instructions:

This is a task for stroke image to real image generation quality evaluation.

You will see 3 images: input image, generated image 1 and generated image 2.

The input image is a "stroke"/"painting" image for a church (shape/color). The generated image 1 and 2 are synthetic images using two different models given the input image.

## Your task is to evaluate which generated image is better overall, based on the following criteria:

- (1) Realism: Prefer the generated image that looks more like a real, photorealistic image.
- (2) Faithfulness: Prefer the generated image that more closely follows the input stroke image.

## Instructions Shortcuts

Input Image

Generated Image 1

Generated Image 2

## Select an option

Generated Image 1 1
Generated Image 2 2
Cannot determine/Equal 3
